U.S. government scientists bombarding skies with acid-rain causing pollutant in name of fighting global warming

Paul Joseph Watson
Prison Planet
Friday, September 5, 2008

U.S. government scientists are bombarding the skies with the acid-rain causing pollutant sulphur dioxide in an attempt to fight global warming by "geo-engineering" the planet, despite the fact that injecting aerosols into the upper atmosphere carries with it a host of both known and unknown dangers.

The proposal to disperse sulphur dioxide in an attempt to reflect sunlight was again raised in a London Guardian article this week entitled, *Geoengineering: The radical ideas to combat global warming*, in which Ken Caldeira, a leading climate scientist based at the Carnegie Institution in Stanford, California, promotes the idea of injecting the atmosphere with aerosols.

"One approach is to insert "scatterers" into the stratosphere," states the article. "Caldeira cites an idea to deploy jumbo jets into the upper atmosphere and deposit clouds of tiny particles there, such as sulphur dioxide. Dispersing around 1m tonnes of sulphur dioxide per year across 10m square kilometres of the atmosphere would be enough to reflect away sufficient amounts of sunlight."

Experiments similar to Caldeira's proposal are already being carried out by U.S. government - backed scientists, such as those at the U.S. Department of Energy's (DOE) Savannah River National Laboratory in Aiken, S.C, [who this year conducted studies](#) which involved shooting huge amounts of particulate matter, in this case "porous-walled glass microspheres," into the stratosphere.

The project, which reached its conclusion this past April, is closely tied to an idea by Nobel Prize winner Paul Crutzen, who "proposed sending aircraft 747s to dump huge quantities of sulfur particles into the far-reaches of the stratosphere to cool down the atmosphere."

Such programs merely scratch the surface of what is likely to be a gargantuan and overarching black-budget funded project to geo-engineer the planet, with little or no care for the unknown environmental consequences this could engender.

What is known about what happens when the environment is loaded with sulphur dioxide is bad enough, since the compound is the main component of acid rain, [which according to the EPA](#) "Causes acidification of lakes and streams and contributes to the damage of trees at high elevations (for example, red spruce trees above 2,000 feet) and many sensitive forest soils. In addition, acid rain accelerates the decay of building materials and paints, including irreplaceable buildings, statues, and sculptures that are part of our nation's cultural heritage."

The health effects of bombarding the skies with sulphur dioxide alone are enough to raise serious questions about whether such programs should even be allowed to proceed.

The following health effects are linked with exposure to sulphur.

- Neurological effects and behavioural changes
- Disturbance of blood circulation
- Heart damage
- Effects on eyes and eyesight
- Reproductive failure
- Damage to immune systems
- Stomach and gastrointestinal disorder
- Damage to liver and kidney functions
- Hearing defects
- Disturbance of the hormonal metabolism
- Dermatological effects
- Suffocation and lung embolism

According to the [LennTech website](#), "Laboratory tests with test animals have indicated that sulfur can cause serious vascular damage in veins of the brains, the heart and the kidneys. These tests have also indicated that certain forms of sulfur can cause foetal damage and congenital effects. Mothers can even carry sulfur poisoning over to their children through mother milk. Finally, sulfur can damage the internal enzyme systems of animals."

Fred Singer, president of the Science Environmental Policy Project and a skeptic of man-made global warming theories, warns that the consequences of tinkering with the planet's delicate eco-system could have far-reaching dangers.

[Notice](#)

"If you do this on a continuous basis, you would depress the ozone layer and cause all kinds of other problems that people would rather avoid," said Singer.

Even Greenpeace's chief UK scientist - a staunch advocate of the man-made global warming explanation - [Doug Parr has slammed](#) attempts to geo-engineer the planet as "outlandish" and "dangerous".

Stephen Schneider of Stanford University, [who recently proposed](#) a bizarre plan to send spaceships into the upper atmosphere that would be used to block out the Sun, admits that geo-engineering could cause "conflicts between nations if geoengineering projects go wrong."

Given all the immediate dangers associated with bombarding the atmosphere with sulphur dioxide, along with the unknown dangers of other geo-engineering projects, many people are concerned that "chemtrails" could be a secret component of the same agenda to alter the Earth's eco-system.

This graphic proposes, "Spraying aluminum powder and barium oxide into high levels of the atmosphere, again delivered by aircraft, to increase planetary reflectance (albedo) and cloud cover." High levels of barium have been found in substances associated with chemtrails.

Reports of chemtrails, jet plumes emitted from planes that hang in the air for hours and do not dissipate, often blanketing the sky in criss-cross patterns, have increased dramatically over the last 10 years. Many have speculated that they are part of a government program to alter climate, inoculate humans against certain pathogens, or even to toxify humans as part of a population reduction agenda.

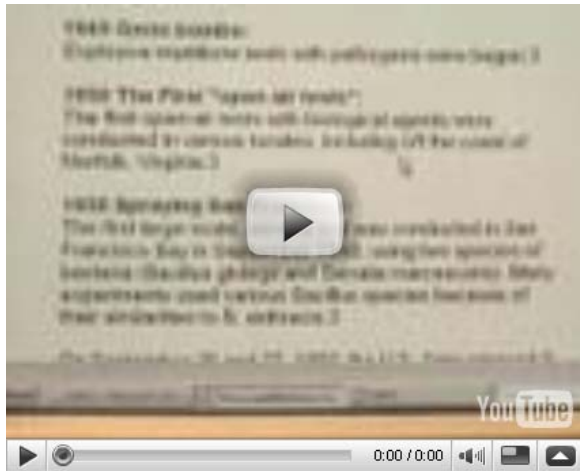

In conducting Google searches, one finds discussion, [such as this example](#), of using sulphur dioxide as a jet fuel additive to be dispersed over the world during routine commercial flights.

"I suggest that both the sulphur dioxide and the silica particles could be delivered into the stratosphere by dissolving an additive in jet aviation fuel," writes engineer John Gorman, who has conducted experiments to test the feasibility of such a scenario.

"We would want to burn fuel containing the additive specifically when the aircraft was cruising in the lower stratosphere," he adds.

Earlier this year, [KSLA news investigation](#) found that a substance that fell to earth from a high altitude chemtrail contained high levels of Barium (6.8 ppm) and Lead (8.2 ppm) as well as trace amounts of other chemicals including arsenic, chromium, cadmium, selenium and silver. Of these,

all but one are metals, some are toxic while several are rarely or never found in nature.

The newscast focuses on Barium, which its research shows is a "hallmark of chemtrails." KSLA found Barium levels in its samples at 6.8 ppm or "more than six times the toxic level set by the EPA." The Louisiana Department of Environmental Quality confirmed that the high levels of Barium were "very unusual," but commented that "proving the source was a whole other matter" in its discussion with KSLA.

KSLA also asked Mark Ryan, Director of the Poison Control Center, about the effects of Barium on the human body. Ryan commented that "short term exposure can lead to anything from stomach to chest pains and that long term exposure causes blood pressure problems." The Poison Control Center further reported that long-term exposure, as with any harmful substance, would contribute to weakening the immune system, which many speculate is the purpose of such man-made chemical trails.

Indeed, barium oxide has cropped up repeatedly as a contaminant from suspected geoengineering experimentation.

KSLA also put aerosolized-chemical testing in its historical context, citing a voluminous number of unclassified tests exposed in 1977 Senate hearings. The tests included experimenting with biochemical compounds on the public. KSLA reports that "239 populated areas were contaminated with biological agents between 1949 and 1969."

One of the accepted truisms of scientific study is the fact that if scientists are proposing an idea, then those scientists with access to the bottomless pit of black-budget secret government funding are already doing it.

It is highly likely that chemtrails are merely one manifestation of "geo-engineering" that is taking place without proper debate, notification or any form of legality, and with a callous disregard for the potential dangers to both our health and our environment.

Seven years after the attacks of 9/11, a global awakening has taken place, the likes of which the world has never seen. As the corporate-controlled media dwindles into extinction, a new breed of journalists and activists has emerged.
